

EventControl

Multi Application & Equipment

Configuration window

EventControl seamlessly integrates hardware and software to automate a number of actions for an event and comply with pre-configured rules.

EASY CONFIGURATION

The EventControl application is easily pre-configured using the utilities provided. The configuration can be set to follow legislative requirements, such as Regulation 109, force policies, or simply to make the system more intuitive to the user. Modes of use can be set up easily to allow some users access to applications that are hidden to others. This is an especially useful feature in the case of twin crew and single crewed vehicles for safety reasons. Additionally, certain applications can be set to run at appropriate times and a higher priority placed on some applications during startup to optimise processing power.

MULTIPLE TRIGGERS

Actions can either be triggered by an event that has been selected by the operator through the touchscreen, or by the many peripheral inputs of the Attobus M-PC systems, including third party auxiliary electronics. Audio messages and sounds can be set so that when an event is triggered, the user is provided with a useful audible reminder. The system's powerful functionality allows up to 16 actions to be specified for each event.

REGULATION 109 COMPLIANCE MADE SIMPLE

Regulation 109 compliance, where video images are not to be displayed to the driver in a moving vehicle, can be handled by EventControl. The range of responses can be configured from the simplest blanking of the whole screen through to making combinations of applications inaccessible to the operator whilst driving, but leaving others accessible.

iDVR INTEGRATION

Within the Attobus iDVR (Integrated Video Recorder) application, the screen can be configured to blank the camera's video when the vehicle is in motion whilst preserving full video recording. EventControl can also display up to six messages on the video input during recordings that relate to a particular event, such as vehicle registration number, user sign-on details and custom messages.

EXAMPLE EVENTCONTROL CONFIGURATION

On selecting the '999 MODE' button on the touchscreen, EventControl can automatically launch the following actions, leaving the driver free to drive safely to the scene. The actual functionality is supported by installed hardware and software.
